

CASE 8

Thanks to Dr Gareth Ansell for sharing this case!

Have a look at the following case and try to interpret the TEG first yourself

You can use either:

1) the TEG6s cheat sheet (on the next two pages).

(* Thanks to the anonymous people who made this cheat sheet)

2) The Mater Hospital TEG interpretation guide

Disclaimer: These cases are provided for educational purposes only, they do not constitute medical advice. You should follow your local institutional policies and use your own clinical judgement.

ALGORITHM

	STEP 2	STEP 1	STEP 3			
	ACT	R	K	ANGLE	MA	LY30
CK		7.6 4.6-9.1	1.3 0.8-2.1	73.0 63-79	58.3 52-69	0.0 0.0-2.6
CRT	83.0 82-152	0.3 0.3-1.1	1.4 0.8-2.7	74.0 66-79	60.2 52-76	0.0 0.0-2.2
CKH		7.3 4.3-8.3	1.2 0.8-1.9	74.0 64-77	59.0 52-69	
CFF					22.0	420.0 276-581

AIMS: CK R <9 mins
CK R = CKH R
CRT MA >52mm
CFF MA >15mm
CRT LY30 <2%

TEG

RECHECK TEG

- 1) After products given
- 2) If bleeding continues

PHYSIOLOGICAL TARGETS

T >36.0
pH >7.2
Ca >1.0
Hb >70 or higher as indicated

THEORY

FOUR TRACES

CK – KAOLIN ACTIVATED

KAOLIN ALONE: traditional TEG trace showing total clotting profile

CRT – RAPID TEG

KAOLIN + TISSUE FACTOR: causes rapid clot formation shortening R time. Fastest to show MA & LY30

CKH – HEPARINASE

KAOLIN + HEPARINASE: removes heparin effect. Otherwise comparable to CK trace.

CFF – FUNCTIONAL FIBRINOGEN

KAOLIN + PLATELET INHIBITOR: shows fibrinogens specific contribution to MA, by inhibiting platelets.

STEP 1: MA Result in ~10-15 mins

CFF MA < 15mm

CFF MA Normal
CRT MA < 52mm

Low CRT MA <52mm &
Low CFF MA <15mm
→ Low fibrinogen definite
→ Low platelets possible
→ Check platelets on FBC
→ Recheck TEG after replacing fibrinogen

↓ FIBRINOGEN

Often first to deplete

Cryoprecipitate OR Fibrinogen Conc

CFF MA	<15mm	10u	2g
	<10mm	20u	4g
	<5mm	20-30u + TXA	4-6g + TXA

~5u cryo OR ~1g fib conc may raise CFF MA ~2mm

↓ PLATELETS

Deficit or Disorder (i.e. antiplatelet)

Pooled Platelets

CRT MA	<50mm	1u
	<25mm	2u

MA = Maximum Amplitude

STRENGTH of clot formed by FIBRINOGEN crosslinking with PLATELETS

STEP 2: R Result in ~10-15 mins

CK R >9 mins

CK & CKH R both prolonged to same extent
→ Coagulation defect, but not due to heparin

CKH R shorter than CK R

↓ COAG FACTORS

Deficit or Disorder (i.e. anticoagulant)

FFP OR Prothrombinex
2-4u 25-50u/kg

HEPARIN EFFECT

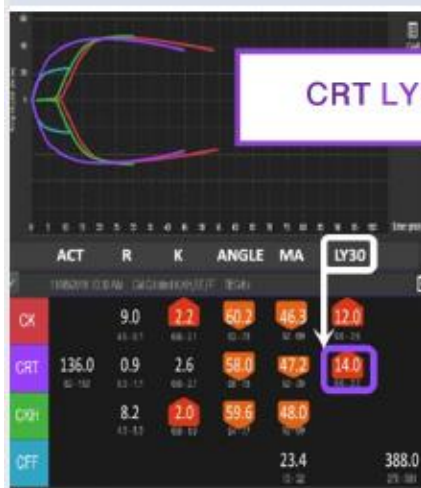

Protamine
~1mg /100u heparin

OR as per local cardiac/bypass protocols

R = Reaction Time
TIME taken for COAGULATION FACTORS to initiate clot formation

STEP 3: LY30 Result in ~40-45 mins

CRT LY30 >2.2%

HYPERFIBRINOLYSIS

Tranexamic Acid (TXA)
1g over 10 mins, followed by 1g over 8hs

Preemptive Use:
Major trauma, give within 3 hours (CRASH 2)
Consider in surgery where major bleeding occurs or is anticipated

LY30 = Lysis % at 30 mins
STABILITY of clot. Amount of clot broken down by FIBRINOLYSIS at 30 minutes after MA

Mater TEG Interpretation

Step 1: Fibrinogen

CFF < 15 – Fibrinogen deficiency

CFF A10 MA 7-14 - low fibrinogen

**Action: Give Fibrinogen concentrate 2-4gm
Or cryoprecipitate 1unit/10kg**

CFF A10 MA <7mm - critically low fibrinogen

Action: Give Fibrinogen concentrate 4-6gm

NB: Each 1g of fibrinogen concentrate increases CFF MA by approximately 2mm for a 70kg patient

Step 2: Platelets

If CFF A10 MA is normal and CRT A10 MA

<50mm - platelet deficiency

Action: Give 1 dose platelets

Step 3: Coagulation Factors

CKHR >9.1 minutes - Coagulation factor deficiency

Action: Give 2 units FFP

Or prothrombinex 25-50units/Kg

Step 4: Heparin

CKHR normal and CKR >9 minutes (and CK > CKH by >2mm) - consider heparin effect

Action: If heparin given, consider giving protamine 1mg/100units of heparin

Step 5: Fibrinolysis

CRT LY30 >2.2% - hyperfibrinolysis

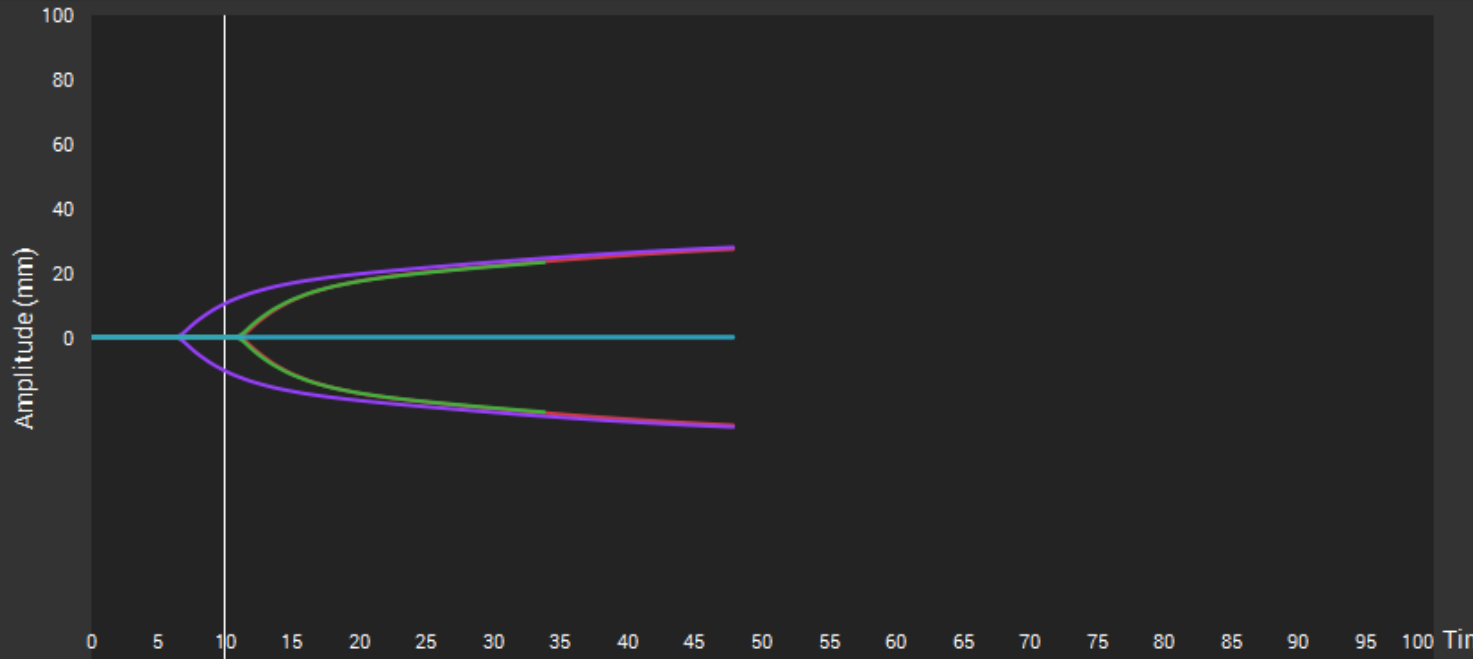

Action: Give 1g Tranexamic acid

Case 8

35 year old female, placental abruption

What does the TEG show?
Try and interpret this yourself first!

What would be your management?

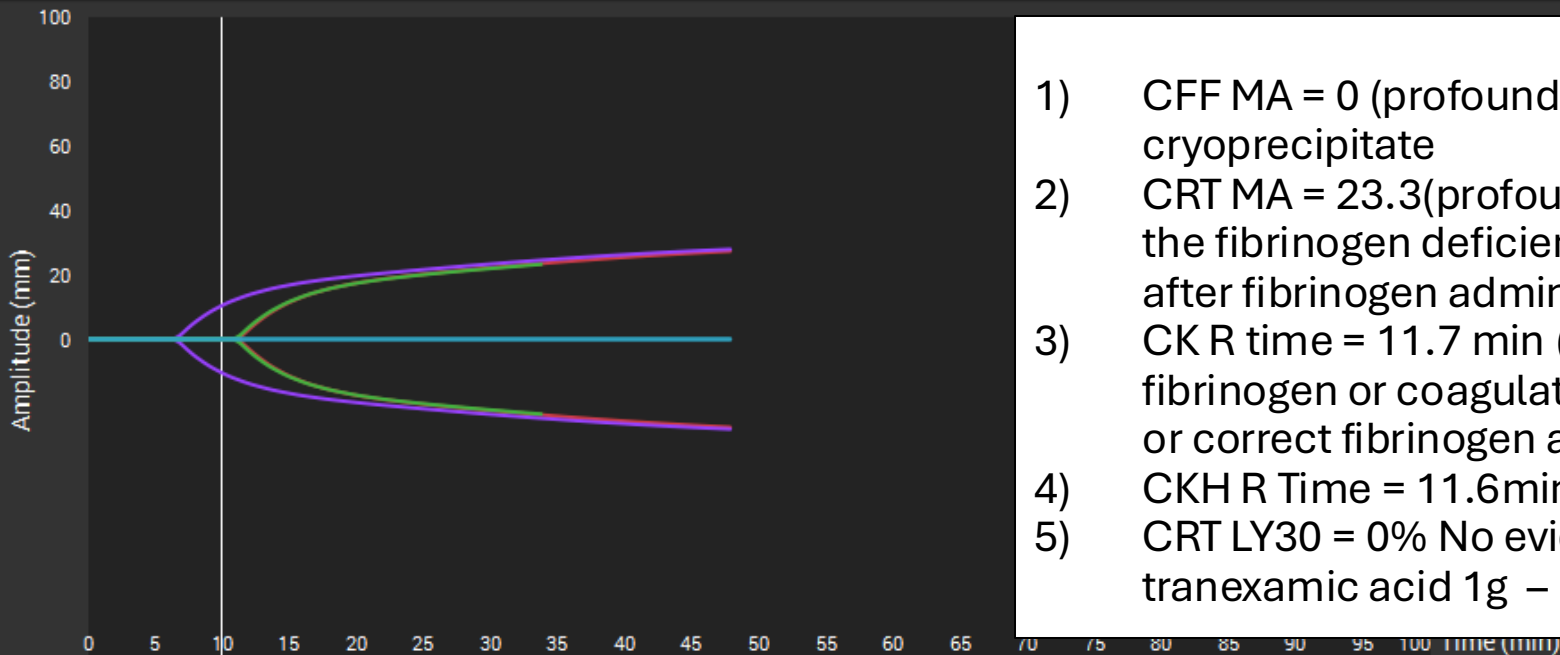

CM Citrated K,KH,RT,FF	TEG-ACT (sec)	R (min)	K (min)	ANGLE (deg)	A10 (mm)	MA (mm)	LY30 (%)
CK		11.7 4.6 - 9.1	12.9 0.8 - 2.1	42.9 63 - 78		24.1 52 - 69	--- 0.0 - 2.6
CRT	714.7 82 - 152	7.1 0.3 - 1.1	13.8 0.8 - 2.7	39.0 60 - 78	18.2 44 - 67	23.3 52 - 70	--- 0.0 - 2.2
CKH		11.6 4.3 - 8.3	13.3 0.8 - 1.9	40.0 64 - 77		23.3 52 - 69	
CFF					--- 15 - 30	--- 15 - 32	

Device Name: TEG 6s

Add Note

Interpretation

- 1) CFF MA = 0 (profoundly low) - Give a large dose of fibrinogen or cryoprecipitate
- 2) CRT MA = 23.3 (profoundly low) - Could be due solely to the fibrinogen deficiency – check platelet count or repeat TEG after fibrinogen administration
- 3) CK R time = 11.7 min (prolonged) – Could be due to lack of fibrinogen or coagulation defect. Consider FFP / Prothrombinex or correct fibrinogen and recheck.
- 4) CKH R Time = 11.6 min - Same as CK R time No heparin effect
- 5) CRT LY30 = 0% No evidence of hyperfibrinolysis – But give tranexamic acid 1g – profound fibrinogen deficiency

CM Citrated K,KH,RT,FF	TEG-ACT (sec)	R (min)	K (min)	ANGLE (deg)	A10 (mm)	MA (mm)	LY30 (%)
CK		11.7 4.6 - 9.1	12.9 0.8 - 2.1	42.9 63 - 78		24.1 52 - 69	--- 0.0 - 2.6
CRT	714.7 82 - 152	7.1 0.3 - 1.1	13.8 0.8 - 2.7	39.0 60 - 78	18.2 44 - 67	23.3 52 - 70	--- 0.0 - 2.2
CKH		11.6 4.3 - 8.3	13.3 0.8 - 1.9	40.0 64 - 77		23.3 52 - 69	
CFF					--- 15 - 30	--- 15 - 32	

For this case patient has 2 litre blood loss secondary to abruption.
TXA given in birth suite.

The patient ended up receiving 9g fib conc (total hospital supply and we have 3 g in theatre).
Each 1 gm of fib conc increases CFF by approx 2mm.

In obstetric patients aim CFF greater than 18mm if patient is bleeding.

I gave 2 units FFP and no platelets.
CFF was so low that the CRT MA will increase with fibrinogen alone.

This is the TEG after:
 Fibrinogen concentrate 9g
 Tranexamic acid 1g
 FFP 2 units

Interprete this TEG now yourself.

Interpretation

- 1) CFF MA = 18.7 (normal)
- 2) CRT MA = 56.7(normal)
- 3) CK R time = 5.1 min (normal) – This has corrected with 9g fibrinogen and 2units of FFP
- 4) CKH R Time = 4.8min - Same as CK R time No heparin effect
- 5) CRT LY30 = 0% No evidence of hyperfibrinolysis - tranexamic acid has already been given

CM Citrated K,KH,RT,FF	TEG-ACT (sec)	R (min)	K (min)	ANGLE (deg)	A10 (mm)	MA (mm)	LY30 (%)

CFF					* 15 - 30	18.7 15 - 32	

Add Note

Device Name: TEG 6s

Take Home Points

- Severe coagulopathy can occur rapidly in abruption sometimes even with only modest amounts of blood loss.
- DIC including fibrinolysis / fibrinogenolysis and profound fibrinogen deficiency can occur.
- Viscoelastic testing to recognise and guide treatment is crucial - standard laboratory tests can be misleading
- See our podcast for a discussion of the mechanism of coagulopathy in abruption
[130 Coagulopathy in abruption a discussion with Graeme - obsgynaecritcare](#)

Thanks again to Dr Gareth Ansell for sharing this great case!
